The NVIDIA A16, built on the NVIDIA Ampere architecture, combines with NVIDIA virtual GPU (vGPU) software to raise the bar on user experience for graphics-rich virtual desktop infrastructure (VDI). As more organizations turn to remote work as long term strategy, A16 with the NVIDIA Virtual PC (vPC) or Virtual Applications (vApps) software, enables knowledge workers across every industry to maximize productivity with performance indistinguishable from a native PC. NVIDIA A16 delivers up to 2X the user density, compared with the previous generation M10, reducing the amount of hardware resources needed and lowering the total cost of ownership (TCO).

When combined with NVIDIA RTX Virtual Workstation (vWS) software, the A16 enables affordable entry-level virtual workstations ideal for running workloads such as computer-aided design (CAD). The A16 features a unique quad-GPU board design enabling the provisioning of mixed user profile sizes, so IT can support light virtual PC workloads as well as users with larger memory and graphics requirements. Mixing user types on a board is also supported, enabling the provisioning of virtual PCs, virtual workstations, and even virtualized compute on a single board.

SUPERIOR STREAMING MEDIA PERFORMANCE

The NVIDIA A16 features the highest number of video encoders and decoders with four on-chip hardware encoders (NVENC) and eight decoder (NVDEC) units in a single A16 board. This provides the best encode, decode and transcode performance translating to a maximized number of video streams per A16 board at an attractive price point versus alternative offerings.
Modernize Your VDI and Boost Streaming Media Performance

**DESIGNED FOR ACCELERATED VDI**
Optimized for user density, and combined with NVIDIA vPC software, enables graphics-rich virtual PCs to be accessible from anywhere.

**AFFORDABLE VIRTUAL WORKSTATIONS**
Large framebuffer per user for entry-level virtual workstations, with NVIDIA RTX vWS software, running workloads such as computer-aided design [CAD].

**FLEXIBLY SUPPORT DIVERSE USER TYPES**
Unique quad-GPU board design enables the provisioning of mixed user profile sizes and user types, such as virtual PCs and virtual workstations, on a single board.

**SUPERIOR USER EXPERIENCE**
Provides increased frame rate and lower end-user latency, versus CPU-only VDI, resulting in more responsive applications and a user experience that is indistinguishable from a native PC or workstation.

**DOUBLE THE USER DENSITY**
Purpose-built for graphics-rich VDI, with support for up to 64 concurrent users per board, in a dual-slot form factor.

**HIGH-RESOLUTION DISPLAY**
Supports multiple, high-resolution monitors to enable maximum productivity and photorealistic quality in a VDI environment.

**MORE THAN 2X THE ENCODER THROUGHPUT**
More than double the encoder throughput versus previous generation M10, providing high-performance transcoding and the multiuser performance required for multi-stream video and multimedia.

**HIGHEST QUALITY VIDEO**
Support for the latest codecs, including H.265 encode/decode, VP9, and AV1 decode for the highest-quality video experiences.

**PCI EXPRESS GEN 4**
Support for PCI Express Gen 4 data transfer speeds from CPU memory for data-intensive tasks.

**NVIDIA AMPERE ARCHITECTURE**
NVIDIA Ampere architecture-based CUDA cores, second-generation RT-Cores, and third-generation Tensor-Cores provide the flexibility to host virtual workstations powered by NVIDIA RTX vWS software, or to leverage unused VDI resources to run compute workloads with NVIDIA AI Enterprise software.

**Features**
- Purpose-built for graphics-rich VDI with NVIDIA vPC
- Provides the lowest cost per virtual workstation user with NVIDIA RTX vWS
- Support for all NVIDIA vGPU software editions: NVIDIA vPC, NVIDIA vApps, NVIDIA RTX vWS, NVIDIA AI Enterprise, and NVIDIA vCS
- PCI Express Gen 4
- Latest CODEC support: H.265 encode/decode, VP9, and AV1 decode
